

After watching the video, reading through the article, and taking the quiz to see what type of learner I am, I was very surprised to see that I am a tactile learner (2nd was visual, and 3rd was auditory). I honestly thought I was more of a visual learner, but the more I looked into it the more I realized that I was a tactile learner. I'm not really disappointed or anything, I just honestly wasn't expecting it, but I do like to do things hands on and doing something really helps me understand what it is I need to do.

Someone can tell me over and over on how to do something, but unless I actually get to try and do it myself, I usually don't quite understand how to do it. And I really do think that learning styles matter, knowing how and what helps you learn information the best is a very important tool. I also do think it depends though, I may be a tactile learner, but I also learn very well visually. If someone were to show me how to do something, odds are I can do it too. They do truly reflect how some of us learn, but you still shouldn't feel limited to only using the learning style that it says you have.
