

I find that using the CLI was more challenging for me probably due to the fact that I have very little experience in that category. I have messed around with it using different commands and such but I still have much more to learn. Using the GUI instead made me more comfortable, just because it seems simpler to me. If I were to learn about CLI a bit more I could probably utilize it more efficiently.

When using the command prompt I tend to get myself lost or confused, I don't know the commands very well either despite it telling me what they are. But when it really comes down to it, I just need to learn and practice some more with it to understand it better. I've noticed some pretty unique details about using the command prompt. For example, I like being able to type "systeminfo" and having a list of details about my computer pop up. I've just barely scratched the surface of using command prompts but they seem to tell you details quicker than just using the graphical user interface.

Although the CLI may be quicker in some areas for me, when I use the graphical user interface I can find things much quicker, if I knew more about how to type them in and find them I would definitely do that instead. So overall looking at both of them, I definitely think that using the Command prompt is more interesting and fun then just going about doing things as usual. But I also don't know as much about the command prompt as I do GUI, though utilizing the command prompt efficiently seems more effective.
